

**Panel A: Mean Attack Frequency by Tier
(Median = 1 in all tiers)**

**Panel B: Attack Density per USD Volume
(Reciprocal of Avg Trade Size)**

Source: Dune Analytics sandwich-detection export, 2024--2025. Sample: victim-side base (3,753,857 attack events) and tx_from repeat-victimisation base (741,404 non-bot trader EOAs). Notes: Panel A uses query5c_repeat_victimization_v2 and reports mean attacks per non-bot trader EOA with 95% Poisson confidence intervals; median attacks per trader EOA equals 1 in every tier. Panel B displays attack density per \$1,000 traded on a logarithmic vertical axis. By mechanical identity, Panel B equals 1,000 divided by average trade size by construction, reflecting the 143.8x Institutional-to-Retail trade size spread.
